AI-Driven Manufacturing Intelligence Adaptive Multi-Objective Optimization of Industrial Batch Process

Presented by: Swetha

Srinivas Ramanujan Institute of Technology(SRIT) – 3rd Year Engineering

IIT Hyderabad Hackathon 2026

Problem Statement

Manufacturing industries face:

- High energy consumption
- High carbon emissions
- Batch-level variability
- Conflicting objectives (Quality vs Energy vs Yield vs Performance)

Current systems:

- Static KPIs
- Reactive
- Non-adaptive

Core Challenges

How to simultaneously optimize :

Primary Targets:

- Quality
- Yield
- Performance

Secondary Target:

- Energy Consumption

Our Solution

We propose an:

AI-Driven Multi-Objective Optimization Engine

Core Components:

- ✓ Golden Signature Framework
- ✓ Real-Time Batch Comparison
- ✓ Adaptive Target Setting
- ✓ Continuous Benchmark Updating
- ✓ Decision Support System

System Architecture

Golden Signature Framework

What is Golden Signature?

- It is the Best historical parameter combination
- That achieves optimal multi-objecttive result

Example:

Best Yield + Lowest Energy
Best Quality + High Performance

System compares:

Current Batch vs Golden Signature

Golden Signature Comparison

Metric	Current Batch	Golden Signature	Target Direction	Action
Yield	82%	91%	Increase	Optimize Process Speed
Energy (kWh)	540	480	Decrease	Reduce Hold Time

Multi-Objective Optimization Logic

We optimized:

Here we Maximize:

- Yield
- Performance
- Quality

Here we Minimize:

- Energy Consumption

We use the Approach:

- Weighted scoring mechanism
- Pareto-based comparison
- Historical best benchmark tracking

Multi-Objective Optimization Targets

Objective Type	Goal
Yield	Maximize
Quality	Maximize
Performance	Maximize
Energy Consumption	Minimize

Continuous Learning Mechanism

If new batch performance:

- Exceeds current golden signature

Then:
→ System automatically updates benchmark

This creates:

SELF-IMPROVING OPTIMIZATION SYSTEM

Adaptive Carbon Target Setting

Carbon Emission Formula:

$$\text{Carbon} = \text{Energy} \times \text{Emission Factor}$$

System:

- Calculates batch-level carbon
- Compares with sustainability goal
- Suggests energy adjustments

⭐ GOLDEN SIGNATURE — UPDATED!

Industrial Validation

Tested using:

- Historical batch process data
- Production records
- Energy consumption metrics

Results:

- Reduced energy per batch
- Improved yield consistency
- Optimized operational efficiency

Business Impact

1. 10–15% Energy Savings
2. Reduced Carbon Footprint
3. Improved Batch Consistence
4. Better Asset Utilization
5. Sustainable Manufacturing

Innovation Highlights

1. Dynamic Golden Signature Management
2. Human-in-the-Loop Decision Support
3. Adaptive Goal Optimization
4. Multi-objective balancing
5. Scalable Architecture

Thank you
